Heart J. 5:181-191(1984).

-I. FUNCTION: MUSCLE CONTRACTION.

-I. SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2.

-I. SUBUNITS (HAL), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)

AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

-I. SUBCELLULAR LOCATION: Thick filaments of the myofibrils.

-I. DOMAIN: THE RODLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING

CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,

CYCLES OF A 28-RESIDUES IN THE SI DOMAIN ARE SELECTIVELY

ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

-I. MISCELLANBOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE OF 1512-1938 FROM N.A.

DYSTROPHIN WARRING AND CALLED DYSTROPHIN1, 22 AND 3. DYSTROPHIN1, 22 AND 3. DYSTROPHIN1, 22 AND 3. DYSTROPHIN1, 32 AND 3. DYSTROPHY (BMD) and Becker muscular dystrophy (BMD). DWD is the most common form of muscular dystrophy; a sex-linked recessive disorder. It typically presents in boys aged 3 to 7 year as proximal muscle weakness causing wadding agit, toe-walking, lordosis, frequent falls, and difficulty in standing up and climbing up stairs. The pelvic girdle is affected first, then the shoulder girdle. Progression is steady and most patients are confined to a wheelchair by age of 10 or 12. Flexion contractures and scoliosis ultimately occur. About 50% of patients have a lower 10 than their genetic expectations would suggest. There is no
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   treatment. BMD ressembles DMD in hereditary and clinical features but is later in onset and more benign.

MISCELLANEOUS: THE DMD GENE IS THE LARGEST KNOWN GENE IN HUMANS.

IT IS 2.4 MILLION BASE-PAIRS IN SIZE AND COMPRISES 79 EXONS.

SIMILARITY: THE ACTIN-BINDING DOMAIN IS OF A TYPE FOUND IN MANY ACTIN-BINDING PROTEINS (SUCH AS ACTININ, DYSTROPHIN, FIMBRIN, STMILARITY: CONTAINS 2 CALPONIN-HOMOLOGY (CH) DOMAINS.

SIMILARITY: CONTAINS 2 SPECTRIN REPEATS.

SIMILARITY: CONTAINS 1 WW DOMAIN.

SIMILARITY: CONTAINS 1 WW DOMAIN.

SIMILARITY: CONTAINS 1 WO DOMAIN.

SIMILARITY: CONTAINS 1 WO DOMAIN.

SIMILARITY: CONTAINS 1 L2—TYPE ZINC FINGER.

Exon 3 encodes the hydrophobic pocket adjacent to the AFP-binding site, exon 9 is adjacent to the actin-binding domain, exon 11 is involved in actin-binding, exon 15 in the S2 hinge and exons 18 and 19 the non-coiled tail region.
                                                                                                           Wassenberg D.R. II, Kronert W.A., O'Donnell P.T., Bernstein S.I.;
"Analysis of the 5' end of the Drosophila muscle myosin heavy chain
gene. Alternatively spliced transcripts initiate at a single site and
intron locations are conserved compared to myosin genes of other
                                                                                                                                                                                                                                                                                                                                                                                                                                         Isoforms containing exon 9a are expressed in indirect flight muscles, exons 9a and 9b are expressed in jump muscles, exons 9b and 9c are expressed in other larval and adult muscles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MISCELLANDOUS: EACH MYOSIN HEAVY CHAIN CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (HMM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED

L. -FONGTION: Involved in DNA double-strand break repair (DSBR). The

rad50/mrell complex possesses single-strand endonuclease activity.

RAd50 provides an ATP-dependent control of mrell by unwinding

"Complete primary structure of a scallop striated muscle myosin heavy chain. Sequence compearison with other heavy chains reveals regions that might be critical for regulation.";

J Blol. Chem. 266:18469-18476(1991).
--- FUNCTION: MUSCLE CONTRACTION.
--- FUNCTION: MUSCLE CONTRACTION.
--- FUNCTION: MYSSIN IS A PROFEIN THAT BINDS TO F-ACTIN 6 HAS ATPASE
--- SUBDULTY THAT IS ACTIVATED BY F-ACTIN.
--- SUBDULT: MUSCLE MYSSIN IS A HEXAMERIC PROFEIN THAT CONSISTS OF 2
HEAVY CHAIN SUBDULTS (MHC), 2 ALKALI LIGHT (HAIN SUBUNITS (MLC)
--- SUBCELLULAR LOCATION: THICK filaments of the myofibrils.
--- SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
--- SIMILARITY: CONTAINS 1 1Q DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             X-RAY CRYSTALLOGRAPHY (2.8 ANGSTROMS) OF 777-836.

reticulocyte-binding protein 1 - Plasmodium vivax
C;Species: Plasmodium vivax
C;Species: Plasmodium vivax
C;Date: 04-Mar-1993 #sequence_revision 18-Nov-1994 #text_change 28-Apr-1995
C;Accession: A42771
R;Galinski, M.R.; Medina, C.C.; Ingravallo, P.; Barnwell, J.W.
Cell 69, 1213-1226, 1992
A;Title: A reticulocyte-binding protein complex of Plasmodium vivax merozoites.
A;Reference number: A42771; MUID:92315338; PMID:1617731
A;Accession: A42771
A;Accession: A42771
A;Status: preliminary
A;Molecule type: DNA
A;Residues: 1-2829 <GAL>
A;Rote: sequence extracted from NCBI backbone (NCBIN:108114, NCBIP:108115)
                                                                                                                                                                                                                                                                                                                                                                                                                                                              δÃ
